

Abstract of the Disclosure

5 A device 1 comprises a communication system transmitter
30 for transmitting signals via a radio interface in a
first frequency band. The device further comprises a
receiver 10 for receiving signals via a radio interface
in a second frequency band. The receiver 10 includes an
10 attenuating component 13 for attenuating signals received
by the receiver 10. Moreover, the device comprises a
controlling portion 50 setting an attenuation which is
applied by the attenuating component 13 to received
signals to a higher value, in case the communication
15 system transmitter 30 transmits signals with a power
level exceeding a certain value, and setting an
attenuation which is applied by the attenuating component
13 to received signals to a lower value, in case no
signal is transmitted by the communication system
20 transmitter 30. The invention relates equally to a
corresponding method.
